

FEATURES

- Isolated Output up to 150 Watts
- Quarter Brick Dimension
- Wide input range (180 – 425 VDC)
- Regulated Outputs
- Efficiency up to 89%
- Remote On/Off
- Continuous Short Circuit Protection
- -40 °C to +100 °C
- Voltage/Current/Over-temperature Protection
- Meet Industrial Standard
- Designed to meet UL60950-1 and EN60950
- Designed to meet CE Mark 2014/30/EU

PRODUCT OVERVIEW

This QB series offers up to 150 watts of output power and is housed in an industry standard quarter-brick package with high power density. This QB series features wide input voltage range from 180 to 425 VDC (300 Volts nominal), high efficiency, isolation of 3000 VAC and provide a precise regulated voltage output.

All QB models operate over the temperature range of – 40°C to +105°C. The modules offer Input under voltage lock out (UVLO), and are fully protected against output overvoltage and over temperature conditions. All models have internal over current and continuous short circuit protection. The output voltage can be trimmed to the required voltage and the product includes Remote On/Off function.

This QB series provides efficiency up to 89%, meet industrial standard and is the best choice for military, industrial, distributed power architectures, telecommunications, and mobile applications.

Please contact DATEL if your application requires different output voltage or any other special feature.

APPLICATIONS:

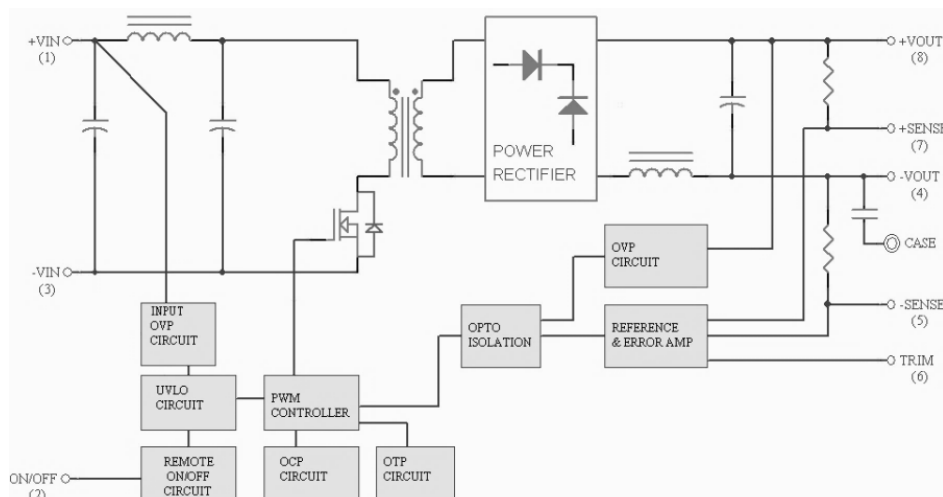

- Defense
- Naval
- Distributed Power Systems
- mobile equipment
- Telecommunications

AVAILABLE OPTIONS

- Customizable Input/ Output voltages
- Heatsink, customizable packaging
- UL/CSA60950-1 and EN60950
- CE Mark 2004/108/EC

MODEL NUMBER	INPUT VOLTAGE	OUTPUT VOLTAGE	OUTPUT CURRENT MAX	EFFICIENCY %	LOAD REGULATION	OPTIONS

POWER DERATING

The operating case temperature range of this QB series is -40°C to +105°C. When operating this QB series, proper derating or cooling is needed. The maximum case temperature under any operating condition should not exceed + 105°C.

Forced Convection Power De-rating without Heat Sink
Example (without heatsink):

AIR FLOW RATE	TYPICAL R _{ca}
Natural Convection	10.1 °C /W
20ft./min. (0.1m/s)	
100 ft./min. (0.5m/s)	8.0 °C /W
200 ft./min. (1.0m/s)	5.4 °C /W
300 ft./min. (1.5m/s)	4.4 °C /W
400 ft./min. (2.0m/s)	3.4 °C /W

What is the minimum airflow necessary for a QB300S12-12.5 operating at nominal line voltage, an output current of 12.5A, and a maximum ambient temperature of 40°C?

Solution:

Given:

V_{in} = 330Vdc, V_o = 12Vdc, I_o = 12.5A

Determine Power dissipation (Pd):

$$P_d = P_i - P_o = P_o(1 - \eta) / \eta$$

$$P_d = 12V \times 12.5A \times (1 - 0.89) / 0.89 = 18.54 \text{ Watts}$$

Determine airflow:

Given: P_d = 18.547W and T_a = 40°C

Check Power Derating curve:

Minimum airflow = 400 ft./min.

Verify:

Maximum temperature rise is

$$\Delta T = P_d \times R_{ca} = 18.54 \text{ W} \times 3.4 = 63.04^\circ\text{C}.$$

The maximum case temperature is

$$T_c = T_a + \Delta T = 103.04^\circ\text{C} < 105^\circ\text{C}.$$

Where:

R_{ca} is the thermal resistance from case to ambient environment, T_a is the ambient temperature, and T_c is the case temperature.

Example (with heatsink M-C421)

AIR FLOW RATE	TYPICAL R _{ca}
Natural Convection 20ft./min. (0.1m/s)	4.78 °C/W
100 ft./min. (0.5m/s)	2.44 °C/W
200 ft./min. (1.0m/s)	2.06 °C/W
300 ft./min. (1.5m/s)	1.76 °C/W
400 ft./min. (2.0m/s)	1.58 °C/W

What is the minimum airflow necessary for a QB300S12-12.5 operating at nominal line voltage, an output current of 12.5A, and a maximum ambient temperature of 40°C?

Solution:

Given:

$$V_{in}=300V_{dc}, V_o=12V_{dc}, I_o=12.5 A$$

Determine Power dissipation (Pd):

$$P_d = P_i - P_o = P_o(1 - \eta) / \eta$$

$$P_d = 12 \times 12.5 \times (1 - 0.89) / 0.89 = 18.54 \text{ Watts}$$

Determine airflow:

$$\text{Given: } P_d = 18.54W \text{ and } T_a = 40^\circ C$$

Check above Power de-rating curve:

$$\text{Minimum airflow} = 100 \text{ ft./min}$$

Verify:

$$\text{Maximum temperature rise is } \Delta T = P_d \times R_{ca} = 18.54 \times 2.44 = 45.24^\circ C$$

$$\text{Maximum case temperature is } T_c = T_a + \Delta T = 85.24^\circ C < 105^\circ C$$

Where:

R_{ca} is the thermal resistance from case to ambient environment, T_a is the ambient temperature, and T_c is the case temperature.

Efficiency versus Load

Operating Temperature Range

The QB series converters can be operated over a wide case temperature range of -40°C to + 105°C. Consideration must be given to the derating curves when maximum power is drawn from the converter. The maximum power drawn from open half brick models is influenced by multiple factors, such as:

- Input voltage range
- Output load current
- Forced air or natural convection
- Heat Sink

Output Voltage Adjustment

The next page describes in detail how to trim the output voltage with respect to its set point. The output voltage on all models is adjustable within the range of +10% to -20%.

Over Current Protection

All models have internal over current and continuous short circuit protection. Once the fault condition is removed, the unit will operate normally. The converter will go into hiccup mode protection once the point of current limit inception is reached.

Output Overvoltage Protection

The output over voltage protection consists of circuitry that internally limits the output voltage. If more accurate output over voltage protection is required then an external circuit can be used via the remote on/off pin.

Note: Please note that device inside the power supply might fail when voltage more than rate output voltage is applied to output pin. This could happen when the customer tests the over voltage protection of unit.

Remote On/Off

The QB series allows the user to switch the module on and off electronically with the remote on/off feature. All models are available in "positive logic" and "negative logic" (optional) versions. The converter turns on if the remote On/Off pin is high (>3.5Vdc or open circuit). Setting the pin low (<1.2Vdc) will turn the converter off. The signal level of the remote on/off input is defined with respect to ground. If not using the remote on/off pin, leave the pin open (converter will be on). Models with part number suffix "N" are the "negative logic" remote On/Off version. The unit turns off if the remote On/Off pin is high (>3.5Vdc or open circuit). The converter turns on if the On/Off pin input is low (<1.2Vdc). Note that the converter is off by default.

Logic State (Pin 2)	Negative Logic	Positive Logic
Logic Low – Switch Closed	Module on	Module off
Logic High – Switch Open	Module off	Module on

UVLO (Under voltage Lock Out)

Input under voltage lockout is standard on the QB unit. The unit will shut down when the input voltage drops below a threshold, and the unit will operate when the input voltage goes above the upper threshold.

Over Temperature Protection

These modules have an over temperature protection circuit to safeguard against thermal damage. Shutdown occurs with the maximum case reference temperature is exceeded. The module will restart when the case temperature falls below over temperature recovery threshold. Please measure case temperature of the center part of aluminum baseplate.

PCB Foot print, Recommended Layout, and Soldering Information

The end user of the converter must ensure that other components and metal in the vicinity of the converter meet the spacing requirements to which the system is approved. Low resistance and low inductance PCB layout traces should be used where possible. Careful consideration must also be given to proper low impedance tracks between power module, input and output grounds. The recommended footprints and

soldering profiles are shown in the next two figures

Lead Free Wave Soldering Profile

Note :

1. Soldering Materials: Sn/Cu/Ni
2. Ramp up rate during preheat: 1.4 °C/Sec (From+ 50°C to +100°C)
3. Soaking temperature: 0.5 °C/Sec (From +100°C to+ 130°C), 60 ± 20 seconds
4. Peak temperature: +260°C, above+ 250°C 3~6 Seconds
5. Ramp up rate during cooling: -10.0 °C/Sec (From+ 260°C to +150°C)

Convection Requirements for Cooling

To predict the approximate cooling needed for the Quarter brick module, refer to the power derating curves. These derating curves are approximations of the ambient temperatures and airflows required to keep the power module temperature below its maximum rating. Once the module is assembled in the actual system, the module's temperature should be monitored to ensure it does not exceed +105°C as measured at the center of the top of the case, thus verifying proper cooling.

Thermal Considerations

The power module operates in a variety of thermal environments; however, sufficient cooling should be provided to help ensure reliable operation of the unit. Heat is removed by conduction, convection, and

radiation to the surrounding environment. The power output of the module should not be allowed to exceed rated power ($V_{o_set} \times I_{o_max}$).

Connection Diagram

The connection for standard use is shown below. An external input capacitor (C1) 180uF for all models is recommended to reduce input ripple voltage. External output capacitors (C2, C3) are recommended to reduce output ripple and noise, 10uF aluminum and 1uF ceramic capacitor for 48Vout, and 10uF tantalum and 1uF ceramic capacitor for other models.

Note:

It is to note that if the impedance of input line is high, C1 capacitance must be more than above. Use more than two recommended capacitor above in parallel when ambient temperature becomes lower than the temperature of -20 °C.

External Input Capacitance

The converters must be connected to low AC source impedance. To avoid problems with loop stability source inductance should be low. Also, the input capacitors (Cin) should be placed close to the converter input pins to de-couple distribution inductance. However, the external input capacitors are chosen for suitable ripple handling capability. Low ESR capacitors are good choice. Circuit as shown as below represents typical measurement methods for reflected ripple current. C1 and L1 simulate a typical DC source impedance. The input reflected-ripple current is measured by current probe to oscilloscope with a simulated source Inductance (L1).

Note:

- L1: 12uH
- C1: 330uF ESR<0.7ohm @100KHz
- Cin: 180uF ESR<0.7ohm @100KHz

TEST SET-UP

The basic test set-up to measure parameters such as efficiency and load regulation is shown below. When testing the modules under any

transient conditions please ensure that the transient response of the source is sufficient to power the equipment under test.
We can calculate:

- Efficiency
- Load regulation
- Line regulation.

The value of efficiency is defined as:

$$\eta = \frac{V_o \times I_o}{V_{in} \times I_{in}} \times 100\%$$

Where:

V_o is output voltage,
 I_o is output current,
 V_{in} is input voltage,
 I_{in} is input current.

The value of load regulation is defined as:

$$\text{Load.reg} = \frac{V_{FL} - V_{NL}}{V_{NL}} \times 100\%$$

Where:

V_{FL} is the output voltage at full load
 V_{NL} is the output voltage at no load

The value of line regulation is defined as:

$$\text{Line.reg} = \frac{V_{HL} - V_{LL}}{V_{LL}} \times 100\%$$

Where:

V_{HL} is the output voltage of maximum input voltage at full load.
 V_{LL} is the output voltage of minimum input voltage at full load.

QB Series Test Setup

Where:

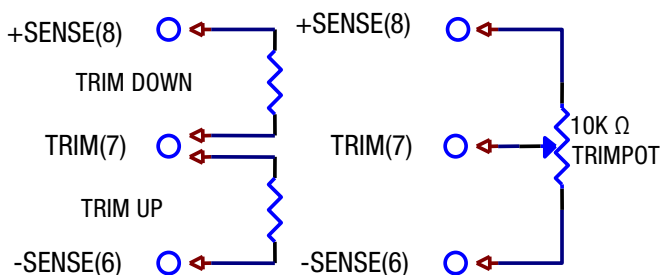

C1: 180uF/100V ESR<0.7Ω

C2: 1uF/ 1210 ceramic capacitor

C3: 10uF aluminum capacitor for 48Vout and 10uF tantalum capacitor for others

Output Voltage Adjustment

Output may be externally trimmed (+10%, -20%) with a fixed resistor or an external trim pot as shown (optional). Model specific formulas for calculating trim resistors are available upon request as a separate document.

In order to trim the voltage up or down, one needs to connect the trim resistor either between the trim pin and -Vo for trim-up or between trim pin and +Vo for trim-down. The output voltage trim range is +10%, -20%. This is shown:

Trim-up Voltage Setup

Trim-down Voltage Setup

V _{out} (V)	R1 (KΩ)	R2 (KΩ)	R3 (KΩ)	V _r (V)	V _f (V)
5V	2.32	1.8	0	2.5	0
12V	9.1	24	5.1	2.5	0.5
15V	12	36	8.25	2.5	0.5
24V	20	68	7.5	2.5	0.5
28V	23.7	68	6.2	2.6	0.5
48V	36	82	5.1	2.5	0.5

Trim Resistor Values

The value of R_{trim_up} is defined as:

For Vo = 5V R_{trim_up} decision:

$$R_{trim_up} = \frac{R_1 V_r}{V_o - V_{o_nom}} - R_2 \quad (\text{K}\Omega) \quad \text{Where:}$$

For others R_{trim_up} decision:

$$R_{trim_up} = \left(\frac{R_1 (V_r - V_f (\frac{R_2}{R_2 + R_3}))}{V_o - V_{o_nom}} \right) - \frac{R_2 R_3}{R_2 + R_3} \quad (\text{K}\Omega)$$

Where:

R_{trim_up} is the external resistor in KΩ.

V_{o_nom} is the nominal output voltage.
 V_o is the desired output voltage.
 R_1 , R_2 , R_3 and V_r are internal components.

For example, to trim-up the output voltage of QB113S12-12.5, 12V output module by 5% to 12.6V, R_{trim_up} is calculated as follows:

$$V_o - V_{o_nom} = 12.6 - 12 = 0.6V$$

$$R_1 = 9.1 K\Omega, R_2 = 24 K\Omega, R_3 = 5.1K\Omega$$

$$V_r = 2.5 V, V_f = 0.5 V$$

$$R_{trim_up} = \frac{18.997}{0.6} - 4.206 = 27.45 (K\Omega)$$

The value of R_{trim_down} defined as:

$$R_{trim_down} = \frac{R_1 \times (V_o - V_r)}{V_{o_nom} - V_o} - R_2 (K\Omega)$$

Where:

R_{trim_down} is the external resistor in $K\Omega$.
 V_{o_nom} is the nominal output voltage.
 V_o is the desired output voltage.
 R_1 , R_2 , R_3 and V_r are internal components.

For example: to trim-down the output voltage of QB113S12-12.5, 12V module by 5% to 11.4V, R_{trim_down} is calculated as follows:

$$V_{o_nom} - V_o = 12 - 11.4 = 0.6 V$$

$$R_1 = 9.1 K\Omega, R_2 = 24 K\Omega, V_r = 2.5 V$$

$$R_{trim_down} = \frac{9.1 \times (11.4 - 2.5)}{0.6} - 24 = 110.98 (K\Omega)$$

The typical value of R_{trim_up}

Vout	5V	12V	15V	24V	28V	48V
Trim up %	$R_{trim_up} (K\Omega)$					
1%	114.2	154.1	160.7	164.0	167.1	147.3
2%	56.20	74.95	77.01	78.64	80.72	71.29
3%	36.86	48.56	49.10	50.18	51.92	45.93

Output Remote Sensing

This QB series converter has the capability to remotely sense both lines of its output. This feature moves the effective output voltage regulation point from the output of the unit to the point of connection of the remote sense pins. This feature automatically adjusts the real output voltage of the QB series in order to compensate for voltage drops in distribution and maintain a regulated voltage at the point of load. The remote-sense voltage range is: $[(+V_{out}) - (-V_{out})] - [(+Sense) - (-Sense)] \leq 10\%$ of $V_{o_nominal}$

When remote sense is in use, the sense should be connected by twisted-pair wire or shield wire. If the sensing patterns short, heavy current flows and the pattern may be damaged. Output voltage might become unstable because of impedance of wiring and load condition when length of wire is exceeding 400mm. This is shown in the schematic below.

If the remote sense feature is not to be used, the sense pins should be connected locally. The +Sense pin should be connected to the +Vout pin at the module and the -Sense pin should be connected to

the -Vout pin at the module. Wire between +Sense and +Vout and between -Sense and -Vout as short as possible. Loop wiring should be avoided. The converter might become unstable by noise coming from poor wiring. This is shown in the schematic below.

Note:

Although the output voltage can be varied (increased or decreased) by both remote sense and trim, the maximum variation for the output voltage is the larger of the two values not the sum of the values. The output power delivered by the module is defined as the voltage at the output terminals multiplied by the output current. Using remote sense and trim can cause the output voltage to increase and consequently increase the power output of the module if output current remains unchanged. Always ensure that the output power of the module remains at or below the maximum rated power. Also be aware that if $V_{o.set}$ is below nominal value, $P_{out,max}$ will also decrease accordingly because $I_{o,max}$ is an absolute limit. Thus, $P_{out,max} = V_{o.set} \times I_{o,max}$ is also an absolute limit.

Output Ripple and Noise

Output ripple and noise measured with 10uF aluminum and 1uF ceramic capacitor across output for 48Vout and with 10uF tantalum and 1uF ceramic capacitor for others. A 20 MHz bandwidth oscilloscope is normally used for the measurement.

The conventional ground clip on an oscilloscope probe should never be used in this kind of measurement. This clip, when placed in a field of radiated high frequency energy, acts as an antenna or inductive pickup loop, creating an extraneous voltage that is not part of the output noise of the converter.

Another method is shown in below, in case of coaxial-cable/BNC is not available. The noise pickup is eliminated by pressing scope probe ground ring directly against the -Vout terminal while the tip contacts the +Vout terminal. This makes the shortest possible connection across the output terminals. Output ripple and noise is measured with 10uF tantalum and 1uF ceramic capacitors across the output.

Output Capacitance

This QB series of converters provide unconditional stability with or without external capacitors. For good transient response, low ESR output capacitors should be located close to the point of load. PCB design emphasizes low resistance and inductance tracks in consideration of high current applications. Output capacitors with their associated ESR values have an impact on loop stability and bandwidth. DATEL converters are designed to work with load capacitance to meet the technical specification.

Remote On/Off circuit

The converter remote On/Off circuit built-in on input side. The ground pin of input side Remote On/Off circuit is -Vin pin. Refer to the below figure for more details. Connection examples see below.

Remote On/Off Connection

Series operation

Series operation is possible by connecting the outputs two or more units. Connection is shown in below. The output current in series connection should be lower than the lowest rate current in each power module.

Simple Series Connect Circuit

Where:

L1, L2: 1.0uH

C1, C2, C3: 180uF/450V ESR<0.7Ω

Note:

1. If the impedance of the input line is high, C1, C2, C3 capacitance must be more than above. Use more than two recommended capacitor as above in parallel when ambient temperature becomes lower than -20 °C
2. Recommend Schottky diode (D1, D2) be connected across the output of each series connected converter, so that if one converter shuts down for any reason, then the output stage won't be thermally overstressed. Without this external diode, the output stage of the shut-down converter could carry the load current provided by the other series converters, with its MOSFETs conducting through the body diodes. The MOSFETs could then be overstressed and fail. The external diode should be capable of handling the full load current for as long as the application is expected to run with any unit shut down. Series for \pm output operation is possible by connecting the outputs two units, as shown in the schematic below.

Simple \pm Output Connect Circuit

Where:

L1, L2: 1.0uH

C1, C2, C3: 180uF/450V ESR<0.7Ω

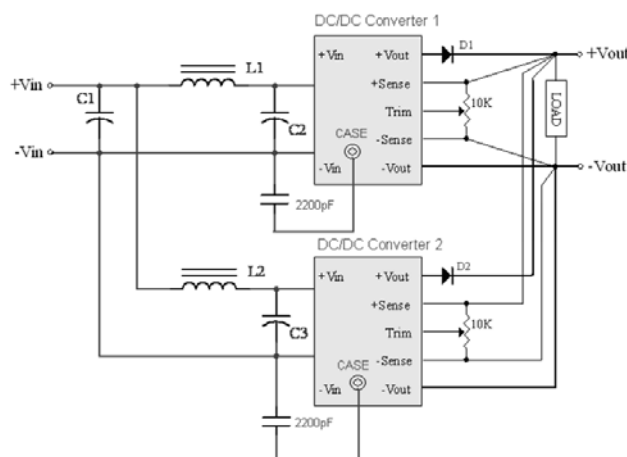

Note:

If the impedance of input line is high, C1, C2, C3 capacitance must be more than above. Use more than two recommended capacitor above in parallel when ambient temperature becomes lower than -20 °C

Parallel / Redundant operation

The QBR series parallel operation is **not** possible.

Parallel for redundancy operation is possible by connecting the units as shown in the schematic below. The current of each converter become unbalance by a slight difference of the output voltage. Make sure that the output voltage of units of equal value and the output current from each power supply does not exceed the rate current. Suggest use an external potentiometer to adjust output voltage from each power supply.

Simple Redundant Operation Connect Circuit

L1, L2: 1.0uH

C1, C2, C3: 180uF/450V ESR<0.7Ω

Note:

If the impedance of input line is high, C1, C2, C3 capacitance must be more than above. Use more than two recommended capacitor above in parallel when ambient temperature becomes lower than -20 °C

SAFETY and EMC

Input Fusing and Safety Considerations

The QB series converters have no internal fuse. In order to achieve maximum safety and system protection, always use an input line fuse. We recommended a time delay fuse 2A. It is recommended that the circuit have a transient voltage suppressor diode (TVS) across the input terminal to protect the unit against surge or spike voltage and input reverse voltage (as shown).

The external input capacitor (Cin) is required for this QB series has to meet EN61000-4-4, EN61000-4-5.

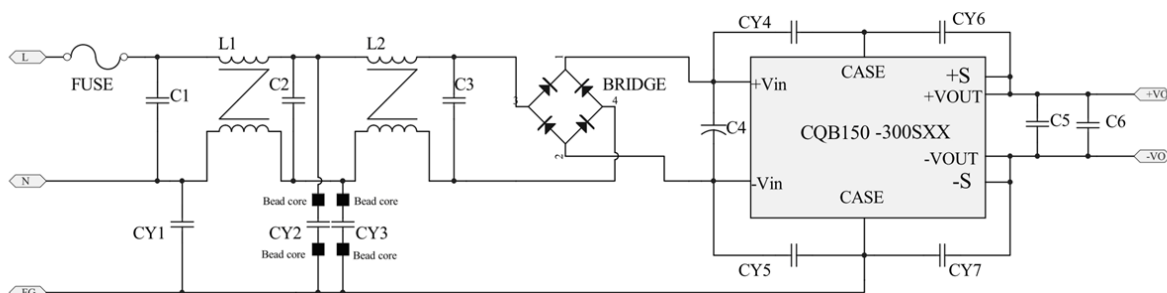

It is recommended to use an aluminum capacitor (Nippon chemi-con KMQ series, 180uF/450V) to connect parallel.

EMC Considerations

EMI Test standard: EN55022 / EN55032 Class A Conducted Emission

Test Condition: Input Voltage: 220VAC, Output Load: Full Load
