

FEATURES

- Industry standard footprint (2.05 inch X 1.2 inch)
- Regulated Outputs, Fixed Switching Frequency
- Up to 92 % Efficiency
- 4:1 Input Range
- Up to 60 Watts of Power
- -40°C to +85°C temperature range
- Remote On/Off logic control
- No Tantalum Capacitors
- Continuous Short Circuit and Over Current Protection

PRODUCT OVERVIEW

This TA series offers up to 40 watts of output power in a standard 2.00 x 1.00 x 0.4 inches package. This series features high efficiency and 1500 Volts of DC isolation. The TA series provides a 4:1 wide input voltage range of 9 to 36 or 18 to 75VDC, and delivers accurate regulated output. These modules operate over the ambient operating temperature range of -40°C to +85°C. These converters are fully protected against input UVLO (Under Voltage Lock Out), over-current, over-voltage and continuous short circuit protection. In addition, the option control functions include Positive Remote On/Off and adjustable output voltage.

APPLICATIONS:

- Distributed Power Architecture
- Mobile telecommunication
- Industrial applications
- Battery operated equipment

AVAILABLE OPTIONS

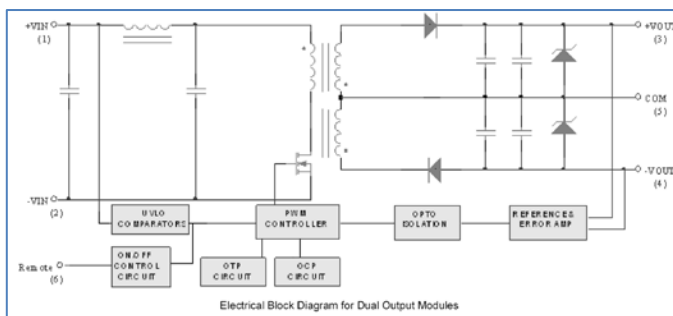

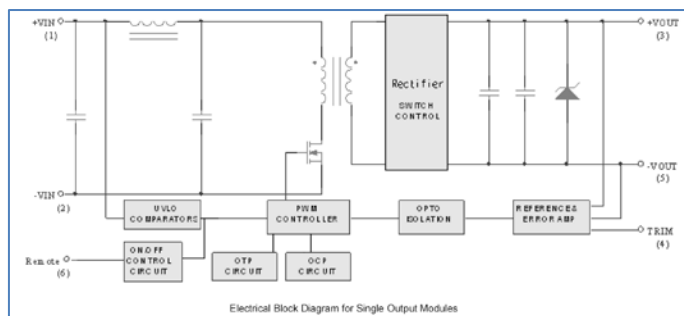

- Customizable output voltages
- CE Mark 2004/108/EC certification
- UL60950-1, EN60950-1, and IEC60950-1 safety

Contact DATEL for other series in 2.00" x 1.20" footprint

- Cost Savings, Lower Power, Other Voltage outputs, Higher Efficiency, etc.

Operating Temperature Range

The TA series of converters operates over the wide temperature of -405°C to +85°C. Derating starts above +45°C. The module has a copper case and case temperature should not go over 105°C.

Output Voltage Adjustment

The output voltage on the T option models is adjustable within the range of -10% to +10%.

UVLO (Under Voltage Lock Out)

Input under voltage lockout is standard on the TA unit. The unit will shut down when the input voltage drops below a threshold, and the unit will operate when the input voltage goes above the upper threshold.

Over Current Protection

All models have internal over current and continuous short circuit protection. The unit operates normally once the fault condition is removed. At the point of current limit inception, the converter will go into hiccup mode protection.

Over Voltage Protection

The over-voltage protection consists of a Zener diode to limit the output voltage.

Over-Temperature Protection (OTP)

This TA series of converters is equipped with non-latching over-temperature protection. If the temperature exceeds a threshold of 110°C (typical) the converter will shut down, disabling the output. When the temperature has decreased the converter will automatically restart. The over-temperature condition can be induced by a variety of reasons such as external overload condition or a system fan failure.

Remote ON/OFF

The remote ON/OFF input feature of the converter allows external circuitry to turn the converter ON or OFF. Active-high remote ON/OFF is available as standard. The converter is turned on if the remote ON/OFF pin is high (>3.5Vdc to 75Vdc or open circuit). Setting the pin low (<1.2Vdc) will turn the converter 'Off'. The signal level of the remote on/off input is defined with respect to "-Vin". If not using the remote on/off pin, leave the pin open (module will be on).

Recommended Layout PCB Footprints and Soldering Information

The end user of the converter must ensure that other components and metal in the vicinity of the converter meet the spacing requirements to which the system is approved. Low resistance and low inductance PCB layout traces should be used where possible. Careful consideration must also be given to proper low impedance tracks between power module, input and output grounds. The recommended footprints and soldering profiles are shown in the next two figures

1.3mm PLATED THROUGH HOLE
2.0mm PAD SIZE

Recommended PCB Layout Footprints, Dimensions are in inches (mm)

Lead Free Wave Soldering Profile

Wave Soldering Profiles

Note :

1. Soldering Materials: Sn/Cu/Ni
2. Ramp up rate during preheat: 1.4 °C/Sec (From 50°C to 100°C)
3. Soaking temperature: 0.5 °C/Sec (From 100°C to 130°C), 60±20 seconds
4. Peak temperature: 260°C, above 250°C 3~6 Seconds
5. Ramp up rate during cooling: -10.0 °C/Sec (From 260°C to 150°C)

TA Series power de-rating Curves

Note that the converter operating ambient temperature range is -40°C to +85°C with derating above +45°C. Also, maximum case temperature under any operating condition should not exceed +105°C.

Note: De-rating measured with nominal line. Output power 60W and converter mounted test board (86x50x1.6mm, 20z)

Example (without heatsink):

TA22S12-5 Operating at nominal line voltage, an output current of 5A, and a maximum ambient temperature of 45°C.

Solution:

Given: $V_{in}=24V_{dc}$, $V_o=12V_{dc}$, $I_o=5A$

Determine Power dissipation (P_d):

$$P_d = P_i - P_o = P_o(1 - \eta) / \eta$$

$$P_d = 5.0 \times 10 \times (1 - 0.92) / 0.92 = 5.22 \text{ Watts}$$

Determine airflow:

Airflow: Natural Convection

Check above Power de-rating curve:

Given: $P_d=5.22W$ and $T_a=45^\circ C$

Verifying: The maximum temperature rise $\Delta T = P_d \times R_{ca} = 5.22 \times 11.25 = 58.73^\circ C$

The maximum case temperature $T_c = T_a + \Delta T = 103.73^\circ C < 105^\circ C$

Where: The R_{ca} is thermal resistance from case to ambience and T_a is ambient temperature and the T_c is case temperature

Top Side of Recommended PCB Layout

Bottom Side of Recommended PCB Layout Size is (86x50x1.6mm, 20z.)

Note: De-rating measured with nominal line. The output power is 60W and the converter with thermal pad SZ 29.5x49.8x0.25mm and heat sink. Mounted test board (86x50x1.6mm, 20z) by M2.5 screw.

Example (with heatsink):

The TA45S5-12 with thermal pad SZ 29.5x49.8x0.25mm and heat sink MC-655 operating at nominal line voltage, an output current of 12A, and a maximum ambient temperature of 60°C.

Solution:

Given: $V_{in}=48V_{dc}$, $V_o=5V_{dc}$, $I_o=12A$

Determine Power dissipation (Pd):

$$P_d = P_i - P_o = P_o(1 - \eta) / \eta$$

$$P_d = 5.0 \times 10 \times (1 - 0.92) / 0.92 = 5.22 \text{ Watts}$$

Determine airflow:

Airflow: Natural Convection

Check above Power de-rating curve:

Given: $P_d=5.22W$ and $T_a=60^\circ C$

Verifying: The maximum temperature rise $\Delta T = P_d \times R_{ca} = 5.22 \times 8.3 = 43.33^\circ C$

The maximum case temperature $T_c = T_a + \Delta T = 103.33^\circ C < 105^\circ C$

Where: The R_{ca} is thermal resistance from case to ambience and T_a is ambient temperature and the T_c is case temperature

Top Side of Recommended PCB Layout

Bottom Side of Recommended PCB Layout

Note: Size is (86x50x1.6mm, 20z.)

Heat Sinks:

Transverse Heat Sink

Note: All Dimensions in mm

Thermal Pad: SZ29.5x49.8x0.25mm (G6135041753)

Screw: M2.5x8mm (G75A3300922)

Washer: (G75A5750052)

Rca: 8.99°C/W (typ.), At natural convection

Rca: 8.3°C/W (typ.), At natural convection, mounted 85x50x1.6mm 20z test board.

Efficiency vs. Load Curves

Efficiency vs. Load Curves

Input Capacitance at the Converter

In order to avoid problems with loop stability, the converter must be connected to a low impedance AC source and a low inductance source. The input capacitors (C_{in}) should be placed close to the converter input pins to de-couple distribution inductance. The external input capacitors should have low ESR in order to quiet any ripple. Circuit is shown in the figure below represents typical measurement methods for reflected ripple current. The capacitor C1 and inductor L1 simulate the typical DC source impedance. The input reflected-ripple current is measured by a current probe oscilloscope with a simulated source Inductance (L1).

L1: 1.2uH
C1: None
C_{in}: 330μF ESR < 0.7ohm @100KHz

Input Reflected-Ripple Test Setup

Test Set-Up

The basic test set-up to measure efficiency, load regulation, line regulation and other parameters is shown in the next figure. When testing the converter under any transient conditions, the user should ensure that the transient response of the source is sufficient to power the equipment under test. Below is the calculation of :

- 1- Efficiency
- 2- Load regulation
- 3- Line regulation

The value of efficiency is defined TA:

$$\eta = \frac{V_O \times I_O}{V_{IN} \times I_{IN}} \times 100\%$$

Where

V_O is output voltage,
I_O is output current,
V_{IN} is input voltage,
I_{IN} is input current.

The value of load regulation is defined AT:

$$\text{Load.reg} = \frac{V_{FL} - V_{NL}}{V_{NL}} \times 100\%$$

Where

V_{FL} is the output voltage at full load
V_{NL} is the output voltage at 10% load

The value of line regulation is defined AT:

$$\text{Line.reg} = \frac{V_{HL} - V_{LL}}{V_{LL}} \times 100\%$$

Where

V_{HL} is the output voltage of the maximum input voltage at full load.

V_{LL} is the output voltage of the minimum input voltage at full load.

TA Series Test Setup

Output Voltage Adjustment (T-Option)

In order to trim the voltage up or down, the user needs to connect the trim resistor either between the trim pin and -Vo for trim-up and between trim pin and +Vo for trim-down. The output voltage trim range is ±10%. This is shown in the next two figures:

Trim-up Voltage Setup

Trim-down Voltage Setup

1. The value of $R_{trim-up}$ is defined as:

$$R_{trim-up} = \left(\frac{V_r \times R1 \times (R2 + R3)}{(V_o - V_{o,nom}) \times R2} \right) - R_t \text{ (K}\Omega\text{)}$$

Where

$R_{trim-up}$ is the external resistor in Kohm.

$V_{o,nom}$ is the nominal output voltage.

V_o is the desired output voltage.

$R1$, $R2$, $R3$, R_t and V_r are internal to the unit and are defined in the table below

Trim up and Trim down Resistor Values

Model Number	Output Voltage(V)	R1 (KΩ)	R2 (KΩ)	R3 (KΩ)	Rt (KΩ)	Vr (KΩ)
TA22S3.3-15 TA45S3.3-15	3.3	2.74	1.8	0.27	9.1	1.25
TA22S5-12 TA45S5-12	5.0	2.32	2.32	0	8.2	2.5
TA22S12-5 TA45S12-5	12.0	6.8	2.4	2.32	22	2.5
TA22S15-4 TA45S15-4	15.0	8.06	2.4	3.9	2.7	25
TA22D12-2.5 TA45D12-2.5	±12V	6.8	2.4	2.32	22	2.5
TA22D15-2 TA45D15-2	±15V	8.06	2.4	3.9	2.7	25

For example, to trim-up the output voltage of the 5.0 Volts module (TA22S5-12) by 10% to 5.5V, $R_{trim-up}$ is calculated as follows:

$$V_o - V_{o,nom} = 5.5 - 5.0 = 0.5V$$

$$R1 = 2.32 \text{ K}\Omega$$

$$R2 = 2.32 \text{ K}\Omega$$

$$R3 = 0 \text{ K}\Omega$$

$$R_t = 8.2 \text{ K}\Omega,$$

$$V_r = 2.5 \text{ V}$$

$$R_{trim-up} = \left(\frac{2.5 \times 2.32 \times (2.32 + 0)}{0.5 \times 2.32} \right) - 8.2 = 3.4 \text{ (K}\Omega\text{)}$$

2. The value of $R_{trim-down}$ defined as:

Where

$R_{trim-down}$ is the external resistor in Kohm.

$V_{o,nom}$ is the nominal output voltage.

V_o is the desired output voltage.

$R1$, $R2$, are internal to the unit and are defined in the table below.

$$R_{trim-down} = R1 \times \left(\frac{V_r \times R1}{(V_{o,nom} - V_o) \times R2} - 1 \right) - R_t \text{ (K}\Omega\text{)}$$

Where

$R_{trim-up}$ is the external resistor in Kohm.

$V_{o,nom}$ is the nominal output voltage.

V_o is the desired output voltage.

$R1$, $R2$, $R3$, R_t and V_r are internal to the unit and are defined in the table above Trim down Resistor Values

For example, to trim-down the output voltage of 5.0V module (TA22S5-12) by 10% to 4.5V, $R_{trim-down}$ is calculated as follows:

$$V_{o,nom} - V_o = 5.0 - 4.5 = 0.5V$$

$$R1 = 2.32 \text{ K}\Omega$$

$$R2 = 2.32 \text{ K}\Omega$$

$$R3 = 0 \text{ K}\Omega$$

$$R_t = 8.2 \text{ K}\Omega$$

$$V_r = 2.5 \text{ V}$$

$$R_{trim-down} = 2.32 \times \left(\frac{(2.5 \times 2.32)}{0.5 \times 2.32} - 1 \right) - 8.2 = 1.08 \text{ (K}\Omega\text{)}$$

Noise Measurement and Output Ripple

The test set-up for noise and ripple measurements is shown in the figure below. A coaxial cable was used to prevent impedance mismatch reflections disturbing the noise readings at higher frequencies. Measurements are taken with the output appropriately loaded and all ripple/noise specifications are from 0Hz to 20MHz Bandwidth.

Output Voltage Ripple and Noise Measurement Set-Up

Note: C1: None

C2: 1μF ceramic capacitor

Output Capacitance

This series of converters provides unconditional stability with or without external capacitors. For good transient response, low ESR output capacitors should be located close to the point of load.

SAFETY and EMC

Input Fusing and Safety Considerations

The TA series of converters do not have an internal fuse. However, to achieve maximum safety and system protection, always use an input line fuse. DATEL recommended a time delay fuse of 10A for 24Vin models and 6A for 48Vin modules. The circuit in the figure below is recommended by a Transient Voltage Suppressor diode across the input terminal to protect the unit against surge or spike voltage and input reverse voltage.

Input Protection Circuit

EMC Considerations

EMI Test standard: EN55022 Class A and B Conducted Emission

Test Condition: Input Voltage: Nominal, Output Load: Full Load

Connection circuit for conducted EMI testing

Note: To meet EN55022 Class A without capacitor to the input pin.
